INTRODUCTION + DESIGN GOALS

DESIGN STATEMENT

The Office of Economic Vitatlity (OEV) purchased the grocery store at 1309 Alabama Street in 2019 and subsequently, the title was transferred to the City of Tallahassee to be used for a healthy food store or other economic benefit for the Griffin Heights Neighborhood. The purchase supports Strategy ED&RE 5.1 identified in the Griffin Heights Neighborhood First Plan, which outlines a 'pathway to economic and social improvement for the Griffin Heights Community.'

The design team surveyed existing conditions in October 2022 to provide 1) an assessment of work required to meet current building codes, 2) an opinion of probable cost, and 3) a proposed schedule to complete design. Observations of existing conditions, our recommendations, and opinion of probable cost are included in this report. The design and documentation phases of this project are anticipated to take 4-5 months to complete.

Two options for construction are identified, including 1) renovation of the existing building and site, and 2) demolition of the existing facility/construction of a new building. The design team is sensitive to the positive impact this facility may have on the Griffin Heights community, and proposes use of durable yet cost-effective materials, efficient utilities, and floor plan strategies that maximize opportunity for vendor success. Safety, access, and ease of use will also be considered during future design phases. Community input and potential vendor types will continue to be integrated in to the design.

EXISTING CONDITIONS OBSERVATIONS

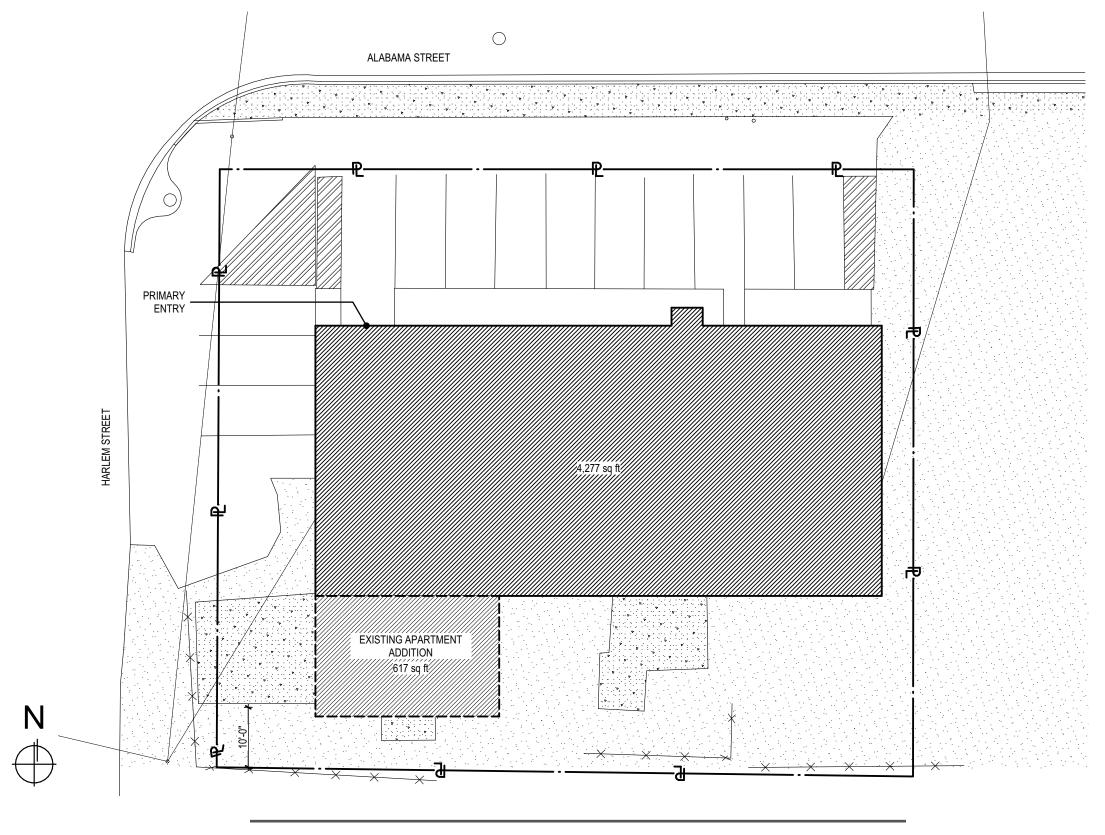

EXISTING CONDITIONS

SITE OBSERVATIONS

As it stands today, the site is in a deteriorated state. The existing asphalt is in poor condition with ill-defined edges. There is a continuous concrete curb ramp from Alabama Street to the ill-defined parking area north of the building. Landscaping areas are minimal on site with no defined ground cover or shrubbery. The plantings that are present appear to be voluntary and are not maintained.

BUILDING OBSERVATIONS

The existing building is a one-story, +/- 4,900 sf concrete block (CMU) building with a wood framed roof system, built in 1953. The flooring system throughout the building is slabon-grade with 3 different finish floor elevations varying by +/-10" from east to west. The presence of a vapor barrier under the slab is not known, but assumed to be an asphalt membrane type if present. The load bearing CMU walls appear to be in fair condition. Interior walls are a combination of CMU and wood studs with either plaster or drywall sheathing. Most interior walls are damaged and not considered serviceable for renovation. There is no observable insulation or vapor barrier present at exterior walls. The roof membrane consists of asphalt shingles over wood decking. The roof envelope has visible holes where the roofing membrane and supporting wood deck are missing and portions of the ceiling have collapsed. Visible signs of wood rot are seen in several locations throughout the building.

EXISTING SITE PLAN

A site visit was performed on Thursday, October 13th 2022, to survey the existing conditions. The following conditions were observed.

EXISTING STRUCTURAL

The primary support members consisted of exterior CMU bearing walls along with interior structural steel framing; wood trusses and plywood decking formed the roof. There were no existing drawings provided - the specific foundation type for this building is undetermined. It is believed to be a shallow concrete foundation based on the general characteristics of the facility.

The primary focus during this inspection was to determine the structural adequacy of the existing building and evaluate its ability to withstand a potential renovation. An assessment of the existing hazards to public safety was also completed, as well as identification of any other structural related concerns that would prevent public occupancy of the structure.

This assessment is limited to the items which were accessible and visible during the time of inspection. Items such as the internal wall reinforcement, building foundation below grade and the various fasteners attaching these components to their respective members, were not inspected. There were also specific areas of the building which were not accessible during the initial inspection that are not explicitly addressed within this report but could also have structural issues outside of the ones that are listed within this report.

INITIAL FINDINGS DURING INSPECTION & PRELIMINARY ASSESSMENT ROOF FRAMING

At the time of inspection, the existing roof was in a state of disrepair. Several portions of the roof had completely caved-in, and the remaining portions appeared to have experienced significant water damage. Based on the severity of the existing damage it is recommended that the roof framing be replaced in its entirety.

INTERIOR STEEL FRAMING

The interior steel framing appears to be in sufficient shape to meet the existing layout, but there could be modifications required to meet the current provisions of the governing codes. As of now, the current members are supporting the roof system that we recommended to be replaced; the new roofing materials and/or layout could significantly impact the existing steel capacities. These steel support members could also be subject to removal to aid in the construction process or due to unknown conditions at the base of the framing (currently concealed).

SLAB ON GRADE

From a structural standpoint the existing slab on grade is likely adequate to meet the future anticipated loading, but there are several service-related issues present. The existing floors are unleveled and there are sporadic step-downs which do not align with any other framing members. This would likely present a tripping hazard and also create difficulties with partitioning this space in the future without a major retrofit option. The most cost-effective solution to addressing the service-related issues with the floor at this facility would likely be to demolish and replace the existing slab in its entirety.

EXTERIOR CMU WALLS

The existing exterior walls are likely sufficient to meet the previous loading but may not be adequate for future use if there is a significant change in the loading conditions. A change in loading could be due to the reconfiguration of a new roof or a reclassification of the building structure. Based on our previous experience with buildings of this nature, there are few cost-effective options to retrofit the exterior walls that would meet the overall budget for this project (if they are found to be inadequate).

ENGINEERING ANALYSIS

EXISTING MECHANICAL

Existing mechanical ductwork and air handling units throughout the entire site were in disrepair and poorly installed in its current state. The powered equipment was at the end of its life and the distribution devices and ductwork were dirty and covered with micro-organisms.

Existing Interior HVAC equipment M# Ahu: Goodman ARUF486016CA; 4 ton unit At its end of life and not functioning. Not worth keeping.

Outside air to the interior units was not located.

Existing outdoor equipment was surrounded by overgrown plants and a torn-up fence. There was a failed roofing system sitting on top of some of the cooler-freezer outdoor units, they seemed to be crushed. There was little chance to access and properly confirm its age. From the visual survey which was able to be performed from outside of the fence the units were in disrepair and did not seem to have been functioning for some time.

Existing exhaust fan and make up air fan for the kitchen equipment was roof mounted with exterior ductwork. This is a poor installation and does not currently meet code. This equipment has not been functioning for some time. It was dirty and in disrepair. Not worth keeping.

EXISTING PLUMBING

Existing plumbing fixtures were in disrepair.

Service piping did not appear to be functioning properly.

The underground sanitary piping was unable to be properly verified but due to its age it is the opinion of this engineer that would be a good idea to run a new service to the building.

Gas service was not able to be located on site but has been confirmed to be available to the site.

The existing water heater was in disrepair and would need to be replaced.

EXISTING ELECTRICAL

Service The building is served from a 120/240V single-phase overhead service and three meters on the west end of the building, and also a 120/240V single-phase overhead service and meter base on the east end of the building. None of the meters are active. NEC (National Electrical Code) requires all services are to be grouped together, so the existing service configuration is not allowed, and will need to be addressed in any contemplated renovation. Also, service may need to be upgraded to 3-phase, depending on final intended occupancy.

Distribution Equipment The distribution equipment consists of single-phase electrical panels, 200A and smaller. The main panel in the area that was previously a store is about 30-40 years old, and is beyond it's expected service life; it should be replaced. Existing location of panels does not seem to allow adequate clearances required by code. Panels need to be replaced as part of any contemplated renovation.

Wiring Several wiring types were observed, including concealed wiring, surface mounted raceway, exposed MC cable, and exposed Romex cable. The exposed cabling is not permitted by NEC, as it is subject to physical damage. General assessment of the wiring system is that it is in poor condition, and should be replaced as part of any contemplated renovation.

Lighting Much of the lighting has been damaged due to vandalism, but, generally, interior lighting is fluorescent, and exterior lighting is florescent or HID type. Lighting and controls are old outdated and will consume much more energy than new LED lighting. Any existing emergency lighting would require replacement of batteries. All lighting should be replaced as part of any contemplated renovation.

Low Voltage Systems No fire alarm is installed. Low voltage cabling is generally outdated and, in some cases, has been damaged due to vandalism. Low voltage systems should be replaced as part of any contemplated renovation.

photo: service/ meter at west end of building. Additional service is at the east end.

photo: main panel in existing store space. This panel is obsolete & beyond expected service life.

photo: store interior. Exposed cabling is not permitted by NEC. Lighting is fluorescent.

RECOMMENDATIONS

SUMMARY

Based on the above observations, as well as observations made by the engineering team, the following conditions must be addressed to bring the existing building up to code to accommodate a grocery tenant.

- 1. The changes in slab elevations must be addressed to provide accessibility if occupied as one tenant. If the building were to be divided into two separate tenants, the change in elevation may not be a problem.
- 2. The exterior CMU walls will require temporary bracing to remain in tact during construction. A secondary wall system will be required interior to the CMU walls to provide additional bracing, provide a cavity for code required insulation, and provide chase area to run utilities.
- 3. The existing roof membrane and roof structure have failed in many locations and require replacement.
- 4. The mechanical, plumbing and electrical systems are all either at the end of expected service life, are in advanced state of disrepair, and are not code complaint for reuse.

Based on the above observations, it is the recommendation of the design team that the existing site elements and building be demolished so that a new low maintenance, code compliant, and energy efficient facility can be constructed.

STRUCTURAL

Given the series of issues within this existing facility, along with all of the unknown conditions yet to be discovered, the most effective solution for this project would be to demolish the existing structure and construct a new facility based on the specific needs of this project.

It the opinion of Johnson + Milner, Inc. (structural engineers) that existing roof structure is beyond repair and that the current slab on grade will also need to be replaced in its entirety (largely due to service-related issues). The remaining exterior walls and supporting steel would need to be temporarily braced and/or shored during the demolition of the slab & roof. This would significantly complicate the demolition process, thus adding additional cost to the overall project with little overall benefit. In other words, the cost of saving the remaining structure (CMU walls & steel beams and columns), could potentially exceed the cost to demolish and replace them items.

There is also the huge potential that other issues may exist within the facility that are currently concealed (i.e., inadequate building foundations, deterioration of framing members below grade, insufficient wall reinforcing steel, issues contained within the inaccessible areas that were not yet inspected, etc.). These issues could further constrain the project moving forward and limit the options for future use.

MECH | PLUMBING

It is the recommendation of FSM Engineering to fully remove all Mechanical/Plumbing equipment, fixtures and service piping and provide new in the next phase.

ELECTRICAL

It is the recommendation of Applied Research and Design, Inc. that all existing electrical systems should be replaced as part of any contemplated renovation. There is no electrical equipment, fixtures, devices, or wiring that merits re-use. Cost for replacement of electrical systems would be about the same whether the existing building is renovated or demolished and replaced with new construction.

ZONING REQUIREMENTS

The parcel size is 0.26 acres in size and is zoned NB-1 (Neighborhood Boundary 1) and is located within the Multi-Modal Transportation District (MMTD). The site was submitted and reviewed by the City Planning Department through the Pre-Submittal Review Process on October 13, 2022. A copy of the comments are included in this report. As a redevelopment under 2,500 square feet of disturbance and/or construction, the project is exempt from Site Plan review, but will be subject to the Building Permit review process. If the building is demolished, the project is subject to Site Plan Review and the requirements of the MMTD zoning requirements.

COT Presubmittal Review Comments:

Caution: The information provided herein may be incomplete. The user of this document is cautioned that the information shown is subject to change prior to issuance of the final set of comments, and receipt of an Applicant Resubmit Assignment notice. An individual should proceed at their own risk when using a list of partial draft comments to formulate reposes prior to receiving the Applicant Resubmit Assignment notice containing the complete list of comments.

				Specific uses are permitted and prohibited in this district. A change of use must be filed with the Building Division upon acquisition of a tenant for a shell space buildout and additional zoning requirements may be implemented at that time.				
ZON3	Zoning	1		Reuse of existing buildings that are not expanded or that are proposed for expansion under 2,500 square feet will not require full Site Plan review but will be reviewed through the building permitting process. Depending on the type of use proposed and the determination of whether it is more intensive and/or building expanding will take into account the following aspects:		Open	10/10/2022	
				**Allowed use (per Sec. 10-272) **Additions must meet setbacks found in Sec. 10- 285 Table 10A **Traffic Concurrency will be required for more intensive change of use and may be required for expansions.				
				**A sidewalk must be provided to the right-of-way from the main entrance of the business. **Expansions and more intensive changes of use may require addition of parking spaces. If no changes are made to the structure and a less or equal change of use is proposed, the parking may remain the same if no changes are made to the vehicular use area.				
				**An off-street loading zone area must be identified on the site plan document.				

<u>Comment</u> <u>ID</u>	<u>Group</u> <u>Name</u>	<u>Cycle</u>	Sheet Name	Comment Text	Reviewer Follow-up	Comment Status	<u>Date</u>	<u>Response</u>
				**A solid waste plan must be approved for the site and placed in a location appropriate to the development and away from the adjacent low-density residential zoning district. **Changes of use without expansion does not require frontage sidewalk improvement. If building expansion is proposed, the sidewalk must be improved to current MMTD standards of 8 feet along Alabama St and 6 feet along Harlem St.				
ZON4	Zoning	1		Replacement of windows in an existing structure must meet the transparency requirements of the MMTD. For non-residential developments, the primary frontage must meet or exceed 60 percent and the corner side frontage must meet or exceed 30 percent.		Open	10/10/2022	

One-story Commercial Building

MMTD Requirements - Transect 3

Building Setbacks

Front (Alabama St.) – 15' min. but no more than 25 feet Side Corner (Harlem St.) – 10' min.

Side Setback - 5' min.

Rear - 15' min.

Parking and roll out barrel setback

- Located in second and third layers. First layer is building disposition from Alabama Street, second layer is 20 feet.
- Trash containers in third layer only.

Intensity - 5000 sf per parcel, 10000 sf per acre.

Requires **Urban buffer** against south property line, min. width is 10 feet with fence.

Parking 4 spaces per 1000 sf (not including H/C), Bike parking 2 sp / 5000sf, 20% of req car spaces (at least ½ bike spaces are covered, enclosed, secured).

Building transparency - 60% frontage to Ala. St., 30% frontage to Harlem between 3' and 8'.

Streetscaping - Street trees are placed in the first layer, min. 1 tree per 20 feet of frontage.

Sidewalks - 8' wide sidewalk on Alabama, 6' wide on Harlem. 6 foot landscape strip between sidewalk and street.

City of Tallahassee Land Development Code

Sec. 5-86 - Stormwater management design standards

Increases in the discharge rate at which stormwater leaves a site shall not be allowed, unless such discharge is into an approved master facility.

Sec. 9-154. - Type A [Site Plan] review

(1) All non-residential development greater than 2,500 square feet or multi-family development, or other triplex, not requesting a deviation or a variance to a development standard.

Sec. 9-155. - Type B [Site Plan] review

(1) All non-residential development greater than 2,500 square feet or mulit-family development other than a triplex requesting a deviation or a variance to a development standard.

See additional requirements for NB-1 zoning

Summary

Existing pervious area should be maintained at or near 2,830 SF to avoid the addition of a stormwater facility. Minimum parking and sidewalk requirements determine impervious area on the site. The resulting area available for the new building footprint is approximately 2,500 SF. Furthermore, if the new building is 2,500 SF or less, a Site Plan review is not required.

NB-1 Neighborhood Boundary 1

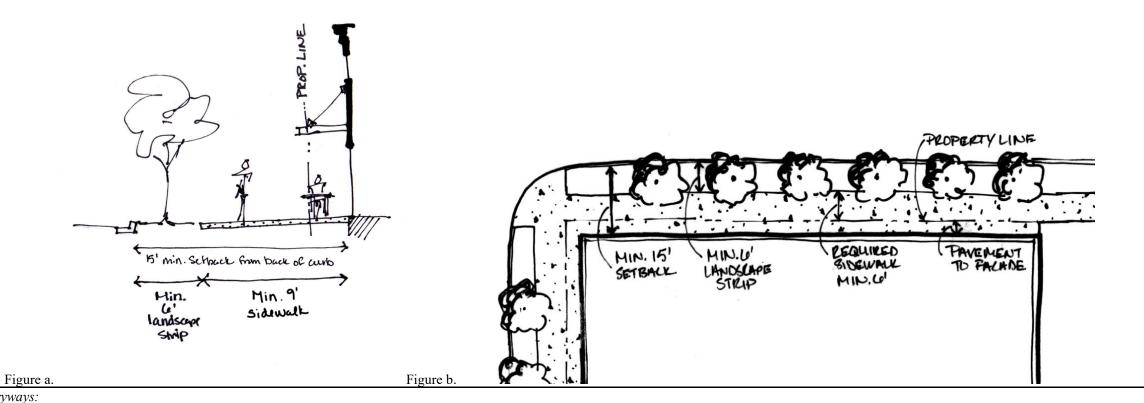

1. District latent The Neighborhood Boundary 1 (NB-1) district is intended to be leased in arraws designated as Neighborhood Boundary on the Future I and Use Map of the Comprehensive Plan and only within the Multi-Model Transportation District. NB-1 district is all and service the below uses are permitted: a. Autique shops b. Laundconnats, laundry and dry-cleaning pick-up stations corridors, or nodes, with neighborhood-scale, non-residential uses and a variety of residential development and one within the NB-1 district is designed to allow low- and medium-density residential, and non-residential development select to serve its surrounding neighborhood was a limited restrict, office, and community services. To revern negative impacts from increased vehicular traffic, auth-oriented uses a knimited restrict, office, and community services. To revern negative impacts from increased vehicular traffic, auth-oriented uses, such as gas stations or drive through facilities are probleted. The maximum grose density allowed for new residential development in the NB-1 district is eightness (10 per particular). The maximum grose density allowed for new residential development in the NB-1 zoning district shall compty with all standards applicable to Tansset 31 (37) of the MMTD Code and the additional Development Standards contained in note 5 herein. 2. Principal Use 2. Limited retail and service the below uses are permitted: a. Autique shops b. Laundconnate, lumby and dry-cleaning pick-up stations. C. Maining services, increased contained to the community and dry-cleaning pick-up stations. C. Retail package lique. b. Restaurantement without drive-through facilities are probleted. b. Standa for principal uses are probleted. b. Standards are probleted. b.		PERMITTED AND I	PROHIBITED USES	
The Neighborhood Boundary of Kill-I) district is intended to be located in areas designated as Neighborhood Boundary on the Future Land Use Map of the Comprehensive Plan and only within the Multi-Modal Transportation District. NB-I districts shall either serve as a buffer between residential development and more intensive development, or be used to establish mixed-use continued Planeauching. Sense of Place, Neighborhood, or Sector Plan. The NB-I district is designed to allow low- and medium-density residential, and non-residential development standed to serve the surrounding neighborhood such as limited retail, office, and community services. To prevent negative impacts from increased vehicular traffic, auto-oriented uses, such as gas stations or drive-through facilities are prohibited. The maximum gross density allowed for new residential development is 20,000 square feet per acre. Building folloptins for non-residential uses shall be limited to 5,000 gross square feet. Development within the NB-1 zoning district stall comply with all standards applicable to Transect 3 (T3) of the MMTD Code and the additional Development Standards contained in note 5 kerein. The maximum gross density allowed for mew residential development is 20,000 square feet per acre. Building folloptins for non-residential uses shall be limited to 5,000 gross square feet. Development within the NB-1 zoning district stall comply with all standards applicable to Transect 3 (T3) of the MMTD Code and the additional Development Standards contained in note 5 kerein. Development within the NB-1 zoning district standards contained in note 5 kerein. Development within the NB-1 zoning district standards contained in note 5 kerein. Development within the NB-1 zoning district standards contained in note 5 kerein. Development within the NB-1 zoning district standards contained in note 5 kerein. 	located in areas designated as Neighborhood Boundary on the Future Land Use Map of the Comprehensive Plan and only within the Multi-Modal Transportation District. NB-1 districts shall either serve as a buffer between residential development and more intensive development, or be used to establish mixed-use corridors, or nodes, with neighborhood-scale, non-residential uses and a variety of residential uses where identified in a City coordinated Placemaking, Sense of Place, Neighborhood, or Sector Plan. The NB-1 district is designed to allow low- and medium-density residential, and non-residential development scaled to serve the surrounding neighborhood such as limited retail, office, and community services. To prevent negative impacts from increased vehicular traffic, auto-oriented uses, such as gas stations or drive-through facilities are prohibited. The maximum gross density allowed for new residential development in the NB-1 district is eighteen (18) dwelling units per acre. The maximum gross intensity allowed for new non-residential development is 20,000 square feet per acre. Building footprints for non-residential uses shall be limited to 5,000 gross square feet. Development within the NB-1 zoning district shall comply with all standards applicable to Transect 3 (T3) of the MMTD Code and the additional Development Standards	1. Offices, except those expressly prohibited. 2. Limited retail and service – the below uses are permitted: a. Antique shops b. Laundromats, laundry and dry-cleaning pick-up stations c. Mailing services d. Personal services (barber shops, fitness clubs, etc.) e. Repair services, non-automotive f. Restaurants without drive-through facilities g. Retail bakeries, drug stores, florists, food and grocery, home/garden supply/hardware without outdoor storage, newsstand/books/greeting cards h. Studios for photography, music, art, drama, and voice i. Tailoring 3. Banks and other financial institutions, without drive-through facilities 4. Community facilities related to the permitted principal uses including libraries, religious facilities, and police/fire stations. Other community facilities may be allowed in accordance with Section 10-413 of these regulations. 5. Residential: a. Single-family attached dwellings, not to exceed four attached units b. Single-family detached dwellings c. Two-family dwellings d. Triplexes e. Fourplexes f. Live-work 6. Daycare centers 7. Recreational clubs and lodges, including assembly halls 8. Passive and active recreation facilities 9. Other uses which, in the opinion of the Land Use Administrator, are of a similar and compatible nature to those uses described in this district. Noise and lighting impacts shall be considered when determining the eligibility of additional	The following uses are prohibited in this zoning district: 1. Cocktail lounges, night/dance clubs, and bars 2. Retail package liquor 3. Bail bond agencies/offices 4. Warehouses, miniwarehouses, and self-storage 5. Heavy industrial and light industrial uses 6. Crematoriums 7. Commercial dog kennels 8. Pawn shops 9. Firing ranges 10. Drive-through facilities 11. Rooming houses 12. Motor vehicle fuel sales 13. Pet daycare centers 14. Veterinary services 15. Payday loan offices 16. Automotive repair 17. Car wash 18. Privately owned off-street parking as the sole use	(1) A use or structure on the same lot with, and of a nature customarily incidental and subordinate to, the principal use or structure and which comprises no more that 33 percent of the floor area or cubic volume of the principle use or structure, as determined by the Land Use Administrator. (2) Light infrastructure and/or utility services and facilities necessary to serve permitted uses, as determined by the Land Use

5. Development Standards in addition to the MMTD

- 1. Setback and Alternate Non-residential Setback:
 - a. The default front setback in T3 is a minimum of 15 feet from the property line. If the criteria listed below are met, an alternate front setback of 15 feet from the back of the curb is allowed for new non-

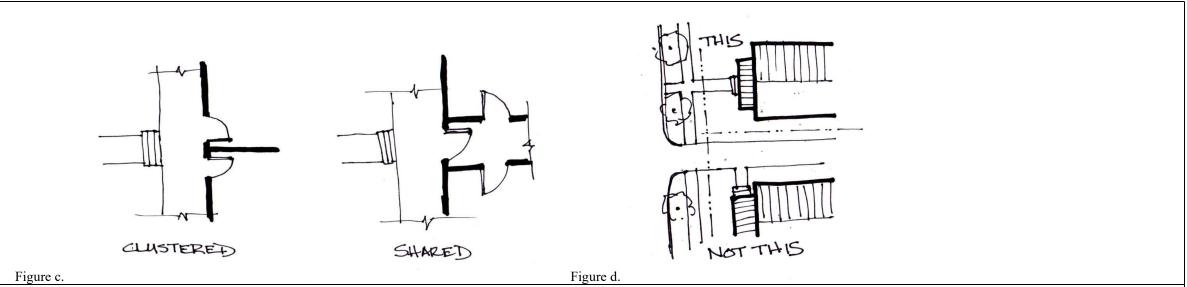

residential development (see Figures a and b):

- 1. The space between the back of the landscape strip and the face of the building is a continuously paved area with a consistent sidewalk pattern that includes two components. First, it has a minimum 6, 8, or 10-foot sidewalk between the landscape strip and the property line, depending on whether the adjoining road is functionally classified as a local, a collector, or an arterial road, respectively. Second, it has an adjacent 3-foot paved area between the property line and the face of the building.
- b. Sites with multiple frontages do not require a front setback deviation for additional frontages if the primary frontage meets the required front setback. This exemption does not apply to corner lots.

2. Entryways:

a. At least one entryway shall be located on the front façade, parallel to the street. Street-facing entries for dwelling units in a duplex, triplex, or fourplex shall be clustered or shared (see Figure C). A dedicated and direct pedestrian path shall be provided from the front entrance to the public sidewalk or street where there is no sidewalk (see Figure d). Driveways do not qualify as a direct pedestrian connection.

3. Lighting Criteria:

Exterior lighting shall include any light source outside a building whether freestanding or on its own pole, attached to a structure, or underneath a roof of an open-sided building and shall meet the following criteria:

- a. For natural quality, lighting elements shall provide full spectrum light to prevent color distortion.
- b. Light overspill onto adjacent properties shall be minimized by a combination of placement of light fixtures, mounting height, natural or artificial barriers on the fixture owner's property, shielding of the light source to direct light onto the surface to receive illumination, and other fixture design features. When abutting existing residential uses, lighting shall not exceed zero point five (0.5) footcandles as measured at the property line six (6) feet above grade.
- c. Motion detector activated lights are permitted and are required to cycle off after five (5) minutes.
- d. Fixtures shall provide evenly zero point five (0.5) foot-candles at street level and at walkways, bike paths and parks. The light level at parking lots shall be no less than zero point four (0.4) foot-candles and no greater than one (1) foot-candle.
- e. Light fixtures in parking lots shall be a maximum of 18 feet in height. Light fixtures along pedestrian walkways shall be a maximum of 12 feet in height.
- f. The use of search lights, laser lighting, or lights that pulse, flash, rotate or simulate motion for advertising or promotions is prohibited.
- g. The use of internally illuminated awnings or canopies, and wall and roof mounted floodlights or spot-lights used for general grounds illumination, is prohibited.
- h. Up lighting is prohibited except when used to accent landscaping.
- i. All exterior lighting shall be full cutoff type (i.e., directed downward and capped), shall be recessed and shielded to conceal the light source, and shall be either LED or metal halide lamps.
- j. Emergency lighting and traffic control lighting are exempt from these standards.
- k. Applications for non-residential and multi-family developments shall be accompanied by a photometric plan and manufacturer's cut sheets to demonstrate compliance with these standards.
- 4. Access Management and Parking Location:
 - a. For non-residential properties on corner lots or with multiple frontages, vehicular access shall be limited to the secondary frontage unless the vehicular access along the primary frontage is shared by multiple properties.
 - b. New development of multiple lots shall require shared driveway access and provide access easements to adjacent properties. If there is an existing access easement with the adjacent property, the development shall utilize the easement.
 - c. Driveways serving single-family homes and duplexes shall not exceed ten (10) feet in width (not including the driveway apron see Figure e).
 - d. Walls of residential garages and carports shall be setback from the principal façade at least four (4) feet. Porches do not qualify as the principal façade (see Figure e).
 - e. Residential front-loading garages and carports shall be setback a minimum of 20 feet from the front property line (see Figure e).

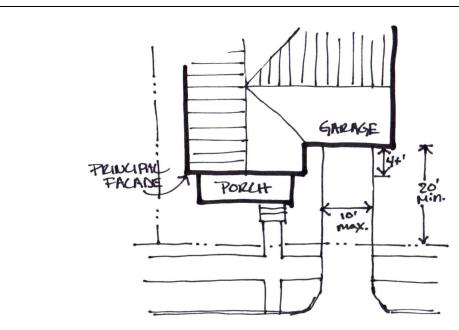

Figure e.

- 5. Fencing and Perimeter Walls, Buffering and Screening Requirements:
 - a. Prohibitions. Barbed wire, razor wire, and electric fencing are prohibited. Chain link fencing is not permitted for non-residential uses within view of the public right-of-way.
 - b. Height. Fences and perimeter walls shall not exceed six (6) feet in height. Fences within the first layer shall not exceed four (4) feet in height.
- c. Required Screening. Non-residential uses shall provide an opaque six (6)-foot fence at the property line shared with any residential use, except that the fence shall not be located any closer than 15 feet to the front or street side property line. The finished side of the fence shall face the residential property.
- 6. Solid Waste Restrictions:

For new non-residential uses, roll out solid waste containers are required and shall not be placed within the first or second layer or within 30 feet of an adjoining existing residential use. Roll out solid waste containers shall be screened from view from any adjacent right-of-way. Dumpsters shall be prohibited.

- 7. Neighborhood Character and Architectural Design
 - a. All roofs for principal structures in residential development shall be hipped or gabled (see Figure f).

COST ANALYSIS

OPINION OF PROBABLE COST

Option 1 - Remodel Existing Building

Remove existing concrete slabs, windows, doors, roof, roof structure, hvac systems, plumbing systems, and electrical systems. The existing CMU walls are the only building elements remaining after demolition. Temporary bracing is required to shore up the walls until stabilized as the project progresses. New construction includes 4" concrete slab with vapor barrier, cementitious siding on wall furring, roof structure and roofing, interior studs around perimeter wall w/ R-13 batt insulation, windows and doors, perimeter 5/8" drywall painted, 2x4 lay-in ceilings, 1 - ADA accessible bathroom, DX HVAC system with interior ductwork distribution, plumbing, new electrical service panel and distribution. No refridgeration, millwork, or displays are included. Sitework includes demolition of the apartment, misc. site dmolition, patch parking, sealcoat and stripe parking, new ADA parking space and signage, service drive, fencing, modest landscaping and sod.

COMMUNITY ENGAGEMENT

COMMUNITY INPUT

A community engagement event was held on November 14th at the Lawrence-Gregory Community Center. Members of the Griffin Heights Neighborhood, COT staff, and several members of the design team were in attendance. John Baker, Manager for COT Neighborhood Affairs, discussed the purpose of the meeting and introduced the design team. ALW's Ryan Sheplak addressed the design team's goals and conditions of the existing building and site. A Q&A session took place before breaking out into small sessions, where members of the community spoke directly with the design team to express concerns and goals, and to ask questions specifically related to the project.

The design team received both written and oral feedback from the community. A record of our findings are as follows.

Written submissions by meeting attendees:

- Replace the building @ 1309 Alabama St. from the ground up.
- Additional land for parking i.e. Sterling Jackson family.
- Continue to black-owned.
- The timeline should be addressed w/ the community. We are not comfortable with a 11/2 year time frame.
- No cigarettes, no beer, no drugs.
- 2 individuals do not have a personal connection.
- They want a solution-build/ renovate the store guickly.
- Well-lit site.
- Decent marquee & signage.
- Grocery store w/ meat & vegetables (smoked meat), rice, pasta
- ADA accessibility.
- Security.
- Bakery.
- Community store.
- Seasonal minority vendor space.
- Personal hygiene items.
- Small shopping carts with security measures.
- Cooked food (Prepared meals).
- Traffic control devices in surrounding areas.
- Additional sidewalks.
- Flashing lights for pedestrian crossing.
- Deli
- Housing as opposed to commercial use.

COMMUNITY INPUT

Verbal input as noted by ALW attendees:

- Cost and schedule are critical concerns. There are hopes to complete design and construction in less than a year. Final solution shouldn't come at a high cost.
- Affordable and healthy foods are priority.
- Safety concern: no alcohol and cigarettes
- Safety concern: shop not to become a drug dealing spot after hours.
- Grocery should also be a food stamp pick-up point (consider the parking lot.)
- Available for all + easy access.
- Bring in potential vendors to community discussions (Kenny Barber).
- Insulate building from the interior if feasible.
- There are hopes the City will purchase the adjacent property to support the success of the grocery store through outdoor gathering spaces, additional parking, etc.
- Some expressed there is no sentimental attachment to the building.
- Any concept that has multiple food options is favorable. Current public transit routing to nearest grocery/dining options is problematic (multiple bus stops and long walking distances), particularly for the elderly.
- Consider a full store (no dining space) similar to a Green Walmart (all produce).
- A neighborhood market could be successful here, though parking may be an issue.
- Consider tearing down and building new.
- Potential vendors were questioned: who manages the store, and how is produce delivered?
- Consider a garden that supports the store or engages the neighborhood (personal engagement while adding to the community).
- Can it serve children and the elderly?
- The market concept was questioned: do people bring in what they collect from their own gardens?
- Bus stop is an important, particularly if parking spots remain limited.
- The architect's design fees were questioned.
- Potential vendors should be black-owned.
- People from the neighborhood who have relevant skills should be involved with design and construction. Several contractors participated in the event.
